

# Measuring and Reducing Postgres Transaction Latency

*(updated version)*

Fabien Coelho

MINES ParisTech, PSL Research University

pgDay Paris – March 23, 2017

### 2 Performance Comparisons

- Two Connection Costs
- Latency Pitfalls
- Throughput and Latency Control
- Three Storage Options
- Two Protocol Impacts
- Four Query Combination Tricks
- Reducing Server Distance
- Performance Scalability
- Miscellaneous Settings

### 1 Introduction

- Subject
- Typical Web Application
- Transaction Performance Definitions
- pgbench
- General Approach

### 3 Conclusion

- Latency and Throughput Wrap-Up
- Lessons Learned
- Contributions to Postgres

## Small OLTP

## *OnLine Transaction Processing*

- CRUD queries
- data fit in shared buffers
- RW, RO

... **WHERE** pk=?

*small, few GB*

*pgbench builtins*

## Focus

## *and Motivation*

- performance with emphasis on latency
- experiment & measure

*interactive web app*

*do not assume!*

**latency performance : RW ×63, RO ×219**

## 3-Tier Architecture

**Client** user acts on user-agent, sends to  
**Server** process request, database operations to  
**Database** stores and retrieves data

## Database Operations

- Connection *TCP/IP, SSL & AAA*
- Request-Response **cycles** *transfer, parse, plan, execute, transfer back*

## Definitions

*time & operations*

**Throughput** operations per time unit  
*usual approach, load measured in **tps***

*tx/s*

**Latency** time for one operation  
*must fit application requirements*

*ms/tx*

## Comments

- correlated
- max vs enough
- sensitive to many settings
- throughput bottleneck & latency additivity

*and contradictory  
and vice-versa  
net, soft & hard  
deep voodoo!*

## Available Features

**input** SQL-like scripts with minimal client-side language

**options** time to run, prepared, reconnections, ...

**parallelism** threads, clients, asynchronous calls

**output** statistical performance data

## Caveats

- long enough
- several times
- pedal-to-the-metal max speed test

*warm-up, checkpoint and vacuum*

*reproducibility*

*not representative*

## ■ TPC-B-like banking transaction

```
-- random ids and amount
\set aid random(1, 100000 * :scale)
\set bid random(1, 1 * :scale)
\set tid random(1, 10 * :scale)
\set delta random(-5000, 5000)
-- actual transaction
BEGIN;
UPDATE pgbench_accounts
    SET abalance = abalance + :delta WHERE aid = :aid;
SELECT abalance
    FROM pgbench_accounts WHERE aid = :aid;
UPDATE pgbench_tellers
    SET tbalance = tbalance + :delta WHERE tid = :tid;
UPDATE pgbench_branches
    SET bbalance = bbalance + :delta WHERE bid = :bid;
INSERT INTO pgbench_history (tid, bid, aid, delta, mtime)
    VALUES (:tid, :bid, :aid, :delta, CURRENT_TIMESTAMP);
END;
```

## Pattern

- 3 updates
- 1 insert
- 1 select

## Experiment & Measure

*RW or RO*

- one-client runs
- independent tests
- final wrap up

*unless otherwise stated  
one at a time change  
cumulative changes*

## Exploration

*RW or RO*

- two connection costs
- latency pitfalls
- throughput & latency control
- three storage options
- two protocol impacts
- four query combinations
- reducing server distance
- scalability and misc. stuff

# Performance Comparisons

## Two Connection Costs

- Client 8 cores, 16 GB
- LAN 1 Gbps
- Server 16 cores, 32 GB, HDD

## Initialization and Benchmarks

Postgres 9.6.1

<code>pgbench -i -s 100</code>	<b>1.5 GB</b>
<code>pgbench -T 2000 -C "host=server sslmode=require"</code>	<b>36.1 tps</b>
<code>pgbench -T 2000 -C "host=server sslmode=disable"</code>	<b>56.4 tps</b>
<code>pgbench -T 2000 "host=server sslmode=disable"</code>	<b>105.4 tps</b>
■ connection AAA	<b>8.2 ms</b>
■ SSL negotiation	<b>10.0 ms</b>
■ transfers and transactions	<b>9.5 ms</b>

# Performance Comparisons

## Latency Pitfalls

## Version 9.5.5

■ throughput 329.4 tps  
■ average latency 24.3 ms

■ latency std. dev. 79.5 ms

## Version 9.6.1

■ throughput 326.4 tps  
■ average latency 24.4 ms

■ latency std. dev. 20.3 ms

### Version 9.5.5

### Version 9.6.1

What is happening?

- transaction surges are absorbed
- then data are written disk

*Buy Now, Pay Later!*

*in-memory + WAL  
checkpoint*

### Postgres 9.5 Checkpoint

- data writes spread over some time
- OS choose when to actually write
- until `fsync` is called...

*random I/O*

*30s delay on Linux*

***I/O storm – on low-end HDD***

### Postgres 9.6 Checkpoint

- **sorted** data writes spread over some time
- **flush** instructions sent regularly (256 kB)
- when `fsync` is called

*sequential I/O*

*checkpoint\_flush\_after*

*ok!*

# Performance Comparisons

## Throughput and Latency Control

## Pg 9.5 *basic checkpoint*

- slow & skipped 24.0%
- latency  $15.6 \pm 158.3$  ms

## Pg 9.6 *sorted checkpoint*

- slow & skipped 2.7%
- latency  $3.6 \pm 24.6$  ms

## Pg 9.6 *sorted & flushed checkpoint*

- slow & skipped 0.5%
- latency  $2.6 \pm 13.8$  ms

# Performance Comparisons

## Three Storage Options

# FILLFACTOR Storage Parameter

Postgres  
Latency

F. Coelho

```
CREATE TABLE pgbench_accounts(...) WITH (FILLFACTOR = 100);
```

## FILLFACTOR Usage

- MVCC: UPDATE = DELETE + INSERT *up to 3 pages changes*
- some free space available in page *1 inside page change*
- **but** more pages/costs for other operations *trade-off*

## FILLFACTOR = 100

- throughput *406.9 tps*
- latency *19.7 ± 12.3 ms*

## FILLFACTOR = 95

- throughput *416.8 tps*
- latency *19.2 ± 8.3 ms*

## Hard Disk Drive ●

- mechanics
- fast sequential I/O
- **slow** random I/O

vs

## Solid State Disk ●

- electronics
- fast sequential I/O
- **fast** random I/O

```
pgbench -j 4 -c 8 -T 2500 -M prepared ...
```

## Postgres 9.6

**HDD**    406.9 tps     $19.7 \pm 12.3$  ms

**SSD**    4,764.9 tps     $1.7 \pm 2.4$  ms

*checkpoint full page write effect*

```
CREATE UNLOGGED TABLE pgbench_accounts(...);
```

Standard

*ACID*

- throughput *406.9 tps*
- latency *19.7 ± 12.3 ms*

UNLOGGED

*good luck!*

- throughput *5,310.7 tps*
- latency *1.5 ± 0.3 ms*

# Performance Comparisons

## Two Protocol Impacts

```

\set aid random(1, 100000 * :scale)
\set tid random(1, 10 * :scale)
\set bid random(1, :scale)
BEGIN;
SELECT abalance FROM pgbench_accounts WHERE aid=:aid;
SELECT tbalance FROM pgbench_tellers WHERE tid=:tid;
SELECT bbalance FROM pgbench_branches WHERE bid=:bid;
COMMIT;

```

## Operations

- 1 transfers
- 2 parse query
- 3 plan query
- 4 execute query

## Queries on 3 tables

*network protocol*  
*syntax analysis*  
*optimization*  
*cheap if in cache*

## SSL Costs

*time & €*

- negotiation and re-negotiation
- cryptographic functions
- certificate?

## Benefits

*Snake Oil!*

- Confidentiality
- Integrity
- Authentication

```
pgbench -j 1 -c 1 -D scale=100 -f ro3.sql -T 30 "host=server ..."
```

## sslmode=require

*SSL*

- throughput *709.7 tps*
- latency *1.407 ± 0.132 ms*

## sslmode=disable

*clear*

- throughput *781.6 tps*
- latency *1.277 ± 0.034 ms*

*-- prepare once in session*

```
PREPARE Abal(INT) AS
  SELECT abalance
  FROM pgbench_accounts
  WHERE aid=$1;
```

*-- execute multiple times...*

```
EXECUTE Abal(1);
EXECUTE Abal(5432);
EXECUTE Abal(18);
```

ro3.sql

*simple*

- throughput *709.7 tps*
- latency *1.407 ± 0.132 ms*

Prepare

- temporary one-cmd function
- factor out *parse* cost
- keep *plan* and *execute*
- pgbench -M prepared ...

ro3.sql

*prepared*

- throughput *860.0 tps*
- latency *1.161 ± 0.082 ms*

# Performance Comparisons

## Four Query Combination Tricks

*-- update table*

```
UPDATE pgbench_accounts
  SET abalance = abalance + :delta
  WHERE aid = :aid;
```

*-- get updated data*

```
SELECT abalance
  FROM pgbench_accounts
  WHERE aid = :aid;
```

## Standard

- throughput *406.9 tps*
- latency *19.7 ± 12.3 ms*

*-- combined*

```
UPDATE pgbench_accounts
  SET abalance = abalance + :delta
  WHERE aid = :aid
  RETURNING abalance;
```

## UPDATE RETURNING Option

- return updated rows
- one parse, plan, execute

## Combined Update

- throughput *408.2 tps*
- latency *19.6 ± 8.7 ms*

# Client-combined SQL Queries
